The first step of a workflow is the first take. This is the moment when you're most effective in capturing the subject or scene you want to photograph. If a photo does not look sharp or has a poor exposure, the first thing you need to do is correct these problems. If the subject moves, the best way to capture the subject is to react to it. If you have a steady hand and steady camera, the best way to capture the subject is to focus just on the main area of the frame. Once the subject is in focus, take the photo. This is the crucial moment. The photo you capture right after focusing on your subject is the best shot. If you're fast, the subject will be still while the photo is being taken, so you'll have less of a chance to move. In addition, if your subject is moving, it will be in the best position, with the most beautiful light, when your photo is taken. This is often when there is little contrast and the photo needs the most light. The second step of a workflow is the next stop: after you've taken the photo, you must review the photo and decide if it is okay. You want the best possible photo. You don't always want a perfect shot, because some photos look good even without your best shot. However, a poorly exposed photo can be easily corrected with most editing software. If the photo is overexposed, you can cover the blown highlights with brighten and saturation. if you have a photo which is under-exposed and you want a better exposure, you can recover a681f4349e
