Our arguments use only first-moment and stationarity properties, and are the same as for the case of the corresponding Young tower. We also show that, with the same assumptions, the law of a random walk with Bernoulli increments on $\{\mathbb Z\}$ is almost surely invariant under a large transformation. Our arguments are essentially the same as for the Ulam model, but in the case of random walks on $\{\mathbb Z\}$, they also involve ergodic theory. address: - 'Laboratoire de Mathématiques, Université Paris Sud, Bâtiment 425, 91405 Orsay Cedex, France' - 'Mathematical Institute, University of St Andrews, North Haugh, St Andrews, KY16 9SS, Scotland' - 'Institut Camille Jordan, Université Claude Bernard Lyon 1, 43 boulevard du 11 novembre 1918, 69622 Villeurbanne cedex, France' - 'Mathematical Institute, University of St Andrews, North Haugh, St Andrews, KY16 9SS, Scotland' author: - Cyril Banderier - Philippe Duruval - 'Benjamin Gess' - Laurent Saloff Coste bibliography: - 'Ulam.bib' title: Stationarity and weak mixing for the Ulam model and its random walk extension --- [^1] [^1]: Research supported by the European Research Council (grant MTRN-CT-2003-504613) Q: How do I combine two multidimensional arrays in Powershell?
