What's New in the PDF Rider?

PDF software has come a long way since it first appeared more than two decades ago.

Originally only used for editing documents created in the PostScript RIP (raster image processor) format, the format found its way to the office in the form of PDF, which is used for both distributing and printing documents. Although PDF was not properly designed from the beginning (it's known that Sun internally called it "Artwork Formats and Portability"), over the years a lot of work has been done to make it widely usable. And it's one thing PDF is good at: it's readable. In this respect, Microsoft's WinPrint, TrueDoc and Roxio PDF Studio 8 are in a league of their own. In comparison to other readers and viewers, it has a special character: its menu is set up to an impressive degree for first-time users. Read Doc files? Has your colleague used PDFs instead of the document format that's suitable for on-screen use? Or is he working on a format that's not supported by the application he's using at work? That's nothing unusual. However, it's not always so easy to convert from one format to another. If you have ever tried to convert a Microsoft Word document, you know what we're talking about. You can try to save it in the proprietary format, save it with the save as extension, or in the traditional way by just downloading it. However, each time you try to save it in another format, it has to be opened by the application that you intend to use it with. You might be able to save it in the old format and print it in a later version with a printer that accepts that document type, but since each conversion requires either opening the document or opening it in the application with the old format. It's probably the last thing you would want to do, isn't it? A comprehensive list of available and supported file formats is shown in the chart below. We're not too bothered about the years. They just help us to identify which file formats can and cannot be imported. Support all file formats The following file formats are supported by PDF can be imported, but you can also make it import other file formats. Only the available encoders are marked in yellow color. Supported Not supported PS, PDF, DOCX, RTF, DOC, XLS, XPS, HTML, JPG
